

Legal Ease: Conclusion

Legal Ease aims to make legal documents understandable to everyone. The environment setup gives the team a reliable foundation: a React frontend, a FastAPI backend, PostgreSQL in Docker, and clear steps to run everything locally. The UI documentation builds on that with defined users, screens, a design system, accessibility rules and a frontend architecture. Together they let developers and designers work from the same plan.

Guiding principles

- **Clarity:** plain language, one main action per screen, and detail shown on demand.
- **Trust:** a calm look, secrets kept out of Git, fake data in development, and privacy cues in the UI.
- **Inclusion:** WCAG 2.2 AA accessibility and mobile-first layouts from the start.

Next steps

Confirm the real feature list, build the design system in Storybook, then build the core flows (sign-up, upload, document detail). After that, run usability tests with real users before launch.

Legal Ease provides information, not legal advice, and that disclaimer should stay visible in the product. The stack and features in these documents are assumptions and should be confirmed.
