

Epic: Core Functionalities Development

Project: LegalEase

1. Epic Overview

Design and build the main features of LegalEase that deliver its core value to legal users: document handling, legal question answering with citations, document analysis and user feedback.

2. Background & Problem Statement

Legal professionals spend a lot of time reading, searching and summarizing documents. LegalEase must provide fast, accurate and verifiable assistance, and the core features must work reliably before any advanced capability is added.

3. Goals & Objectives

- Deliver the must-have features as a usable first version
- Ensure every answer is accurate and traceable to sources
- Build on the approved model, architecture and API layer
- Keep the experience simple for non-technical legal users

4. Stakeholders

Role	Interest
Product Owner	Feature priorities and release scope
Backend / Frontend Engineers	Feature implementation
ML Engineers	Answer quality, retrieval and prompts
Legal SMEs	Validation of legal accuracy and usefulness
QA	Testing and quality sign-off

5. Scope

5.1 In Scope

- Document upload, parsing and storage
- Legal question answering with source citations
- Document summarization and clause extraction
- Risk and issue flagging in documents
- Search across uploaded documents
- User feedback and correction capture
- User accounts and role-based access

5.2 Out of Scope

- Advanced analytics and reporting
- Integrations with external legal databases (future phase)
- Mobile app

6. Assumptions & Constraints

- Model, architecture and API contract are finalized

- Answers must include citations or be marked low-confidence
- Client data is handled under agreed privacy rules

7. Core Feature List

Feature	Description	Priority
Document management	Upload, parse, store and delete documents	High
Legal Q&A	Ask questions and get cited answers	High
Summarization	Short summaries of long documents	High
Clause extraction	Identify key clauses and terms	Medium
Risk flagging	Highlight unusual or risky language	Medium
Feedback	Rate answers and suggest corrections	Medium

8. Development Approach

- 1 Break features into small, testable stories
- 2 Build in short iterations with regular demos
- 3 Review outputs with legal SMEs each iteration
- 4 Test each feature against the legal test set
- 5 Release the first version to a small pilot group

9. Non-Functional Requirements

- Accuracy: meet the agreed answer and citation quality targets
- Performance: acceptable response time for common requests
- Security: encryption, access control, audit logging
- Usability: clear interface and understandable error messages

10. User Stories

- 1 As a lawyer, I want to upload a contract so that I can analyse it inside LegalEase.
- 2 As a lawyer, I want to ask questions and get answers with citations so that I can verify them quickly.
- 3 As a paralegal, I want a summary of a long document so that I can save review time.
- 4 As a reviewer, I want key clauses extracted and risky language flagged so that nothing important is missed.
- 5 As a user, I want to give feedback on answers so that the product improves over time.

11. Acceptance Criteria

- All high-priority features working end to end in staging
- Answers include citations, or are clearly flagged as low-confidence
- Quality targets met on the legal test set
- Legal SMEs have reviewed and approved sample outputs
- No critical or high-severity bugs open

12. Deliverables & Milestones

Phase	Deliverable
1. Plan	Feature backlog and priorities
2. Build	Core features developed iteratively
3. Validate	Testing and SME review
4. Pilot	Release to a small user group
5. Refine	Fixes and improvements from feedback

13. Risks & Mitigation

Risk	Mitigation
Incorrect or hallucinated answers	Citations, confidence checks, human review
Scope creep	Fixed must-have list, change control
Poor document parsing quality	Test on varied formats, improve parsers
Low adoption	Early pilot and feedback from real users

14. Dependencies

- Model selection and architecture epic
- API logic integration epic
- Pre-requisites (data, access, approvals) in place

15. Success Metrics

- Answer accuracy
- Citation correctness
- Time saved per task
- User satisfaction
- Feature adoption rate

16. Open Questions

- Which document types and languages come first?
- Which jurisdictions must be supported in version 1?
- Who forms the pilot user group?
