

Project Development Phase

Development Document

Field	Details
Project Name	[Your project name]
Development Lead	[Name]
Version	1.0
Date	30 September 2026
Status	Draft

1. Introduction

The Development Phase is where the approved design is turned into a working product. Developers write code, build the features module by module, connect the database and APIs, and test their work along the way.

2. Objectives

- Build all planned features according to the approved design.
- Write clean, readable and well-documented code.
- Integrate frontend, backend, database and external services.
- Test continuously to catch bugs early.
- Deliver a working build on schedule.

3. Development Approach

The team follows an **Agile** approach with short sprints (1 to 2 weeks). At the end of each sprint, a working piece of the product is demonstrated and feedback is collected.

Step	Activity
Sprint Planning	Select tasks from the backlog for the sprint
Development	Code, review and test the selected tasks
Daily Stand-up	15-minute status and blocker discussion
Sprint Review	Demo the completed work to stakeholders
Retrospective	Discuss what went well and what to improve

4. Environment Setup

Environment	Purpose
Local	Individual developer machines for coding
Development	Shared server where features are integrated
Staging	Production-like setup for final testing
Production	Live environment used by real users

5. Technology Stack

Area	Choice
Frontend	[e.g. React / HTML, CSS, JS]
Backend	[e.g. Node.js / Python / Java]
Database	[e.g. MySQL / PostgreSQL / MongoDB]
Version Control	Git and GitHub

Area	Choice
Task Tracking	Jira / Trello

6. Module Development Plan

Module	Tasks	Owner	Status
User Management	Signup, login, roles	[Name]	Not started
Core Feature	Main business logic and APIs	[Name]	Not started
Dashboard / Reports	Charts and data views	[Name]	Not started
Notifications	Email / SMS / in-app alerts	[Name]	Not started

7. Coding Standards

- Use meaningful names for variables, functions and files.
- Keep functions small and focused on one job.
- Add comments where the logic is not obvious.
- Follow one consistent code style across the team.
- Never store passwords or keys directly in the code.

8. Version Control Workflow

- **main**: stable, release-ready code only.
- **develop**: combined work of all developers.
- **feature branches**: one branch per task or feature.
- Every merge goes through a pull request and code review.

9. Testing During Development

Type	Description
Unit Testing	Test individual functions and components
Integration Testing	Test that modules work together
Code Review	Peers check code quality before merging
Bug Tracking	Log, prioritise and fix issues in the tracker

10. Development Risks

Risk	Impact	Mitigation
Technical difficulties	Medium	Build a prototype early, ask for help quickly
Integration problems	High	Integrate often, not only at the end
Code quality issues	Medium	Code reviews and coding standards

Risk	Impact	Mitigation
Delays	High	Sprint tracking and buffer time

11. Deliverables

- Working source code in the repository
- Completed and integrated modules
- Unit test results
- Technical documentation and API notes
- Deployable build for the testing phase

12. Approval

Role	Name	Signature	Date
Development Lead			
Project Manager			
Client / Stakeholder
