

Requirement Analysis Phase

Epic Overview Document

1. Epic Summary

The Requirement Analysis phase turns the selected concept into clear, agreed and testable requirements. The team gathers needs from stakeholders, analyzes and documents them, resolves conflicts, and baselines them so design and development can start with confidence.

2. Goals

- Identify all stakeholders and understand their needs.
- Capture functional and non-functional requirements clearly.
- Remove ambiguity, duplication and conflicts between requirements.
- Prioritize requirements and get formal sign-off.

3. Key Activities

Activity	Description	Output
Stakeholder analysis	Identify users, sponsors and other interested parties.	Stakeholder list
Requirement elicitation	Interviews, workshops, surveys, observation, document review.	Raw requirements
Analysis & modeling	Use case, process flow and data models to clarify needs.	Models and diagrams
Documentation	Write requirements as user stories or SRS statements.	SRS / Product backlog
Prioritization	MoSCoW or value-vs-effort ranking.	Prioritized backlog
Validation & review	Walkthroughs with stakeholders to confirm correctness.	Review feedback
Sign-off & baseline	Formal approval and version control of requirements.	Approved baseline

4. Requirement Types

Type	Examples
Functional	Login, search, report generation, notifications
Non-functional	Performance, security, usability, scalability, availability
Business	Business rules, compliance, cost and timeline targets
Constraints	Technology, budget, regulatory, integration limits

5. Sample User Stories

ID	User Story	Acceptance Criteria
US-01	As a business analyst, I want to record stakeholder needs so that nothing is missed.	All needs logged with source and owner.
US-02	As a product owner, I want to prioritize requirements so that the team builds the most valuable items first.	Every requirement has a priority (Must/Should/Could/Won't).
US-03	As a developer, I want clear requirements so that I can estimate and build correctly.	Each requirement is unambiguous, testable and has criteria.
US-04	As a stakeholder, I want to review and approve requirements so that scope is agreed.	Sign-off recorded; baseline version stored.

6. Deliverables

- Stakeholder register
- Software Requirements Specification (SRS) / product backlog
- Use cases, process flows and data models
- Requirements Traceability Matrix (RTM)
- Signed-off requirements baseline

7. Timeline (Suggested)

Week	Focus
Week 1	Stakeholder analysis and requirement elicitation
Week 2	Analysis, modeling and documentation
Week 3	Prioritization, validation and review
Week 4	Sign-off and baseline

8. Roles & Responsibilities

Role	Responsibility
Business Analyst	Elicits, analyzes and documents requirements

Role	Responsibility
Product Owner	Owns priorities and approves scope
Stakeholders / Users	Provide needs and review requirements
Tech Lead	Checks feasibility and non-functional needs
QA Lead	Reviews testability of requirements

9. Risks & Mitigation

Risk	Mitigation
Unclear or changing requirements	Change control process and regular reviews
Missing stakeholders	Thorough stakeholder mapping early
Scope creep	Baseline requirements and prioritize with MoSCoW
Conflicting needs	Facilitated workshops and product owner decision

10. Success Criteria

- All requirements documented, prioritized and traceable
- No open critical conflicts or ambiguities
- Stakeholder sign-off obtained
- Requirements ready for the Design phase
